

Blood Circulatory System in Human

1 Deoxygenated blood from the body tissues is transported to the heart through the vena cava

2 Blood enters from the right atrium to the right ventricle through the tricuspid valve

3 Blood from the right ventricle is pumped to the lungs through the pulmonary artery

4 In the lungs, carbon dioxide is released and oxygen is absorbed into the blood

5 Oxygenated blood is transported back to the heart through the pulmonary vein

6 Blood enters from the left atrium to the left ventricle through the bicuspid valve

7 Blood is then pumped from the left ventricle to the other parts of the body through the aorta
